

## Status Codes

### Ok (200)

Used when action is successful.

```
return Ok(result);
```

### Created (201)

Used to indicate creation was successful. In code, the first parameter to Created() is the URI path that identifies this resource. It's the same URL used for GET by ID, PUT, and DELETE.

```
return Created($"api/Employees/{newEmployee.Id}", newEmployee);
```

### No Content (204)

Used when no return needed. (commonly deletes)

```
return NoContent();
```

### Not Found (404)

Used when a resource cannot be found.

```
return NotFound("Order not found.");
```

### Bad Request (400)

Used when the request has invalid or missing parameters or body.

```
return BadRequest("Missing apiKey query parameter.")
```

### Other

For other response codes, you can use the generic **Problem** method. Specify the message, then null, then the specific desired status code.

```
return Problem($"The order {id} does not belong to this account.",  
null, StatusCodes.Status403Forbidden);
```
